

Connectors, Patterns & Inspirations

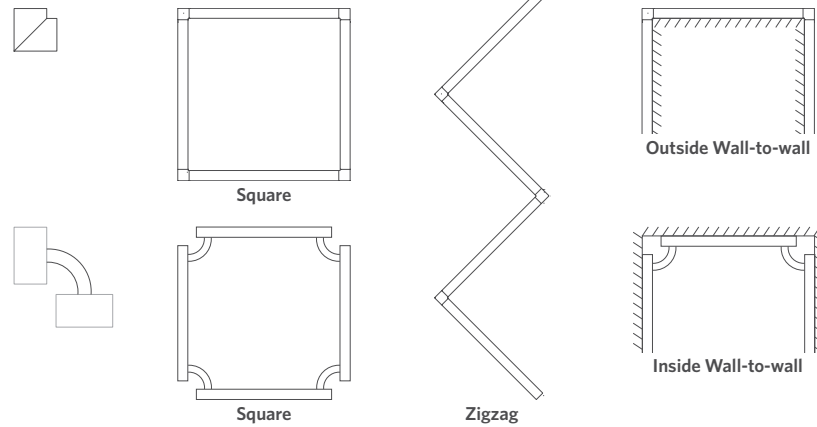

Not everything has to be a straight line. How about a square? Triangle? Octagon? Mix it up even more and create a zigzag line. A ladder? How about a tic-tac-toe game?

With Peerless pattern connectors you can design a suspended lighting system that is not just a straight line. Create configurations to add dimension. Highlight a breakout space. Bring some whimsy and fun to the space. Peerless provides the parts—you provide the vision.

CORNERS

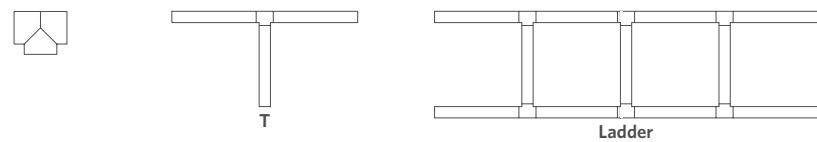

Standard corners are either cast or mitered aluminum. Standard is 90° but with mitered corners other angles may be available.

Sweep corners are available with the Lightedge family and add a unique high-design look to configurations.

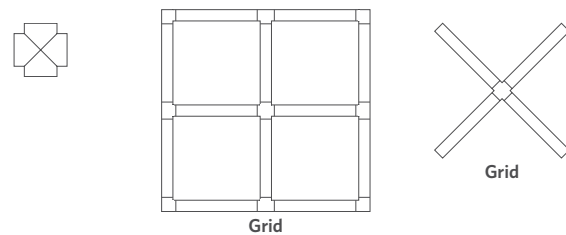

T CONNECTORS

T connectors can be used to form simple configurations or combined with other connector types to form more intricate configurations.

X CONNECTORS

X connectors bring new meaning to the intersection of light and space.

TENONS

Tenons can be used to visually break up a row or to reduce power density by providing more distance between lamp sections.

DESIGN NOTES

SUSPENDED MOUNTING

On-Tenon-Mount (OTM): Available with corners and tenons only, with OTM, the support cable mounts directly to the corner or tenon which reduces the number of support cables required.

T and X Mountings: OTM option not available with T and X connectors. Support cable is required for every luminaire section connected to a T or X connector.

Anodized Finish: Connectors are painted and can not be anodized. We do not recommend combining painted connectors with anodized luminaires because the finish will not match. If a silver look is desired, specify C110 finish which is a silver anodized paint finish.

Custom: Custom angle mitered and sweep corners are available for some luminaires. Contact factory for more information.

WALL MOUNT—INSIDE AND OUTSIDE CORNERS

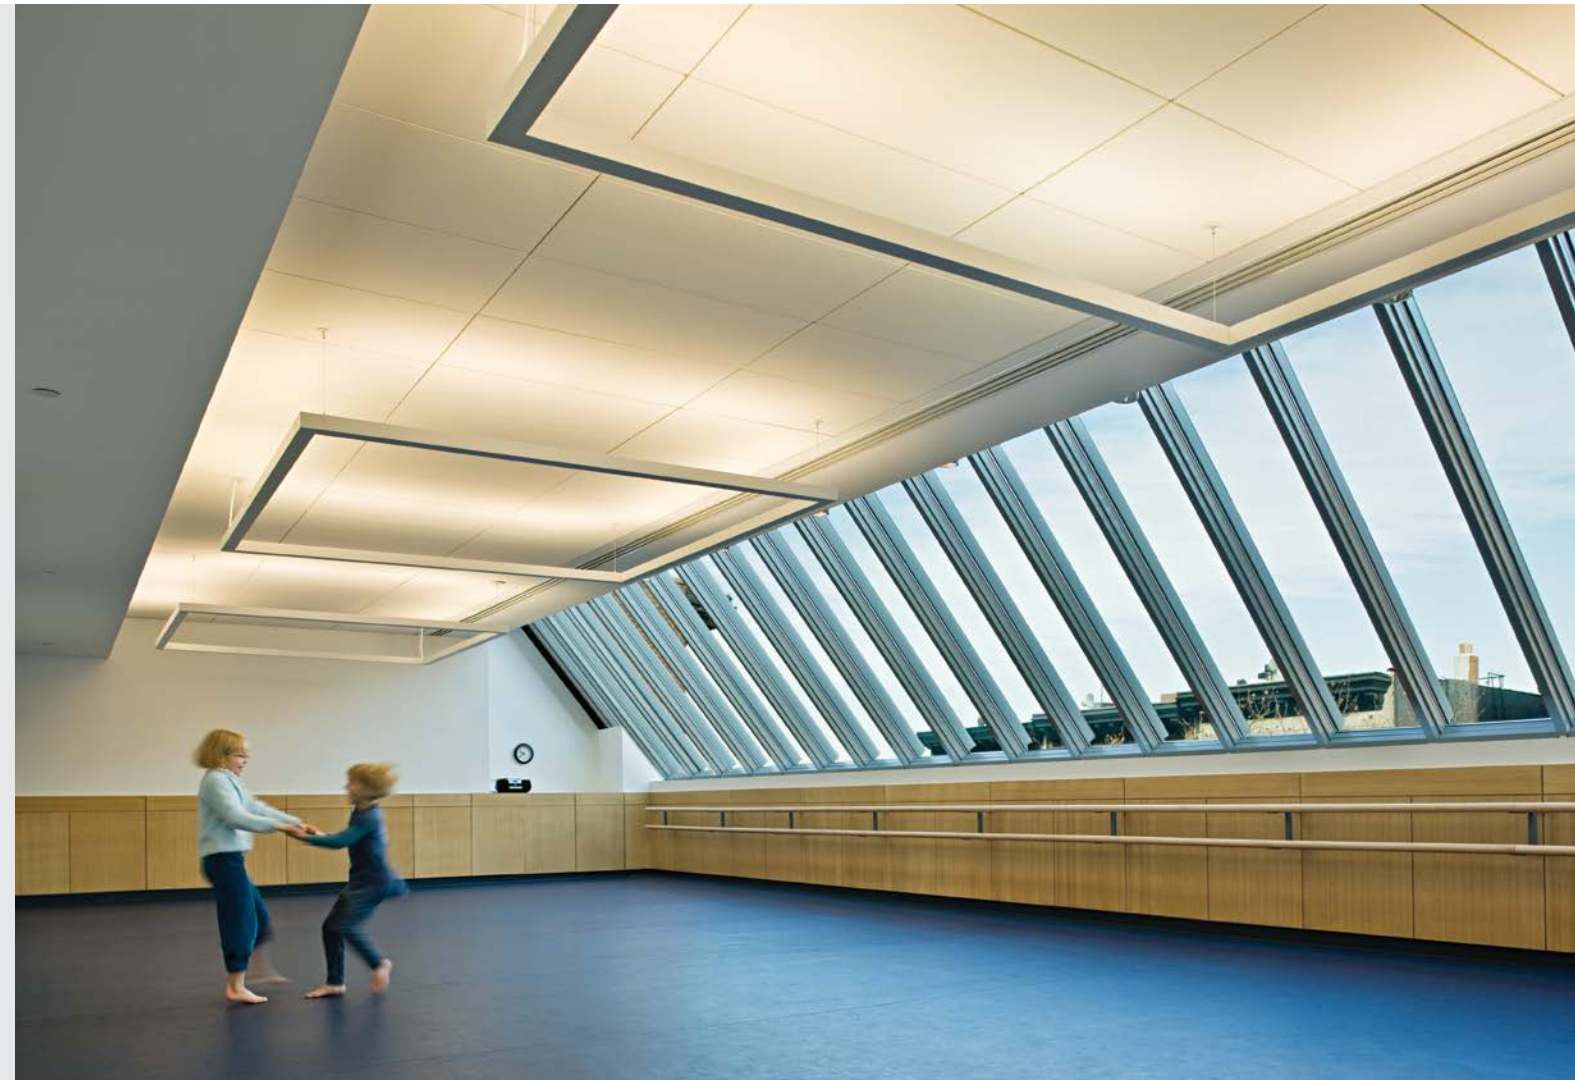

Power and Emergency Feeds: For retrofit projects use tenons and corners to create a combined wall mount row which can be fed from existing power locations to supply light in other parts of the space.

Wall-to-Wall dimensions: Tenons can be used between luminaire sections to create wall-to-wall row.
